Sofia Dermisi
 Sofia Dermisi is a Professor of Real Estate and the Pasquinelli Family Distinguished Chair at Roosevelt University's Walter E. Heller College of Business Administration. Sofia holds a degree in Planning & Regional Development Engineering from the University of Thessaly, Greece and a Master & Doctoral degree from the Harvard Design School, where she earned a departmental commendation for her Masters studies. Sofia's research agenda has always focused on office markets, with an emphasis on terrorism/life-safety issues. She is a member of BOMA/Chicago's security committee, actively participating in the development and execution of Emergency Preparedness Tabletop exercises in the downtown area with the participation of the private and public (local & Federal) sector. She serves as a board member of the American Real Estate Society, editorial board member of the Journal of Sustainable Real Estate, editor of the Data, Methods, and Technology (former Real Estate Information Technology) section of the Journal of Real Estate Literature and a reviewer for seven peer reviewed journals and the National Science Foundation.

Homegrown and transnational terrorism has, and continues to claim the lives of many civilians worldwide through a variety of methods of attack and targets. Terrorists are constantly exploring paths of least resistance and pursuing soft targets (Sandler and Enders 2004; Enders and Sandler 1993) in their politically, ideologically or religiously motivated campaigns while intelligence agencies continuously adjust their counter-terrorism strategies in an effort to foil, obstruct or mitigate potential terrorist attacks. Intelligence experts (R. James Woolsey, Former Director of the Central Intelligence Agency¹) and academics (Dermisi, 2009; Howard and Forest, 2008; Pape, 2003; Quillen 2002; Sandler and Enders, 2000) have acknowledged a disturbing shift, beginning in the 1990s, in terrorist strategy worldwide towards incidents causing increased numbers of casualties. These increased casualties are triggered by two primary trends.

1. Increased targeting of areas of mass gathering, including: transit facilities (Mumbai, India 11/2008, 7/2006; London, UK 7/2005; Madrid, Spain 3/2004; Moscow, Russia 3/2010, 8/2004, 2/2004, 12/2003); government facilities/embassies (Yemen 9/2008; Algeria 12/2007; Nairobi, Kenya and Dar Es Salaam, Tanzania 8/1998; Oklahoma City, USA 4/1995) and private commercial facilities
2. Increased trend of multiple coordinated attacks within a short time frame and/or

geographic location (Mumbai, India 11/2008; London, UK 7/2005).

For private commercial facilities, a number of factors (security creating a layered approach from a building's perimeter, minimization of structural frame vulnerabilities, etc.) can deter terrorist cells from targeting them. The attacks of September 11, 2001 and Mumbai 2008 were significant wake-up calls for both the private office building owners and international hotel chains, respectively. Although an increased number of office buildings applied a variety of security procedures² after 9/11, the extent of these measures was directly correlated to the building's profile (as assessed by counter-terrorism experts), tenant base, ownership and location. While hotel security was also upgraded in certain parts of the world, the Cornell University's School of Hotel Administration has strongly urged additional procedures to be adopted. Housing facilities, particularly those for foreigners in Middle Eastern countries, are also continuously evaluating and adjusting the counter-terrorism tactics with additional layered security measures in an effort to prevent attacks.

Since the 1990s, casualties from terrorist incidents at business facilities have increased, despite the decrease of actual incidents (see Figure 1).

Besides the harm terrorist attacks cause individual victims, attacks targeting commercial facilities cause varying degrees of

Figure 1. Number of terrorist incidents and casualties targeting businesses, 1970–2008. Source: Global Terrorism Database (GTD)

² Some of the security procedures include: standoff distances, planter barricades, parking garage security procedures, surveillance systems (ranging from simple surveillance to pattern recognition systems etc.)

damage to buildings and infrastructure. Figure 2 highlights the worst worldwide insured losses from terrorist attacks targeting facilities.

Although the last major attack affecting commercial facilities was in Mumbai in 2008, a number of terrorist plots have been foiled by intelligence agencies at different planning stages since September 11, 2001 (see Figure 3). The continuation of terrorist plots throughout the world further underscores the need for continuous awareness and communication by both the private and public enforcement/intelligence sectors to prevent and deter possible attacks. Communication has significantly improved between the private sector and public agencies in recent years and in a number of cases, in the US and Europe, it was critical in foiling significant terrorists plots. As numerous intelligence³ sources reiterated in the past and present the issue is not “if” another terrorist attack will occur but “when.”⁴ Improved vigilance and communication can help save many lives. ■
