As each floor rotates, capacity of a different speed, the building changes 8-shaped continuously. "Unconventional planning and design can be...every floor is 'in its own shape,' defined by the plans and then, of course, defined by the movement of each floor."

Additionally, David is working on several other projects including the development of a $2 billion rotating tower. The building will be located in Miami, USA, where the floors will rotate continuously, offering views of the ocean and the city. The building will have a total of 200 units, each offering a unique perspective on the surrounding landscape. The building will be completed by 2023.

Undoubtedly, David is a visionary and a leader in the field of architecture. His innovative ideas and designs are setting new standards in the industry. As we continue to see more buildings like this, it is clear that the future of architecture is bright and exciting. Thank you for sharing your thoughts and insights with us.
